

Luis Jiménez

Data Scientist | Machine Learning | Healthcare & Commercial Analytics | Python | SQL

Mexico City, Mexico | alberto.ji.gut@gmail.com | +52 55 3301 1165 | [linkedin.com/in/luisalbertoig](https://www.linkedin.com/in/luisalbertoig) | github.com/luisajg93

SUMMARY

Data Scientist with a strong healthcare and commercial analytics background, transitioning from 7 years in the pharmaceutical industry into machine learning and data science. Experienced analyzing Power BI and Excel dashboards to identify market trends, segment customers, detect performance gaps, and translate insights into business recommendations for senior stakeholders. Completed 17+ code-reviewed data science projects and continued building additional machine learning, SQL, NLP, and GenAI projects after bootcamp completion. Skilled in Python, SQL, scikit-learn, statistical analysis, predictive modeling, and communicating technical insights for business decision-making.

TECHNICAL SKILLS

Programming & Analytics: Python, SQL, Excel, Power BI, Git, Jupyter

Machine Learning: Classification, regression, Random Forest, XGBoost, LightGBM, KNN, Logistic Regression, clustering, time series

Data Science Methods: EDA, data cleaning, feature engineering, leakage prevention, class imbalance handling, cross-validation, GridSearchCV, model evaluation

NLP & Visualization: spaCy, NLTK, TF-IDF, Hugging Face, FLAN-T5, Matplotlib, Seaborn, Streamlit

PROFESSIONAL EXPERIENCE

High Specialty Sales Consultant | Analytics-Driven Territory Management

AstraZeneca Mexico | Nov 2019 – Nov 2025

- Analyzed Power BI and Excel dashboards covering prescription trends, market share, growth rate, sales coverage, and customer behavior across 120 physicians and 20 commercial bricks to identify growth opportunities and performance gaps.
- Segmented physicians and healthcare accounts based on prescription potential, adoption patterns, access barriers, and sales performance to prioritize visits, events, budget allocation, and cross-functional actions.
- Presented biweekly performance analyses and quarterly business reviews to 10–15 stakeholders, including regional managers, divisional managers, marketing leaders, and the business unit director, translating commercial data into clear recommendations.
- Increased market share from 7% to 30% in one assigned territory and later achieved #1 and #2 market share positions for assigned high-specialty therapies in a separate territory.
- Validated Power BI sell-in data against field-level market knowledge, identified a data capture issue, and helped correct reporting inconsistencies that increased registered sales by 300% for a key commercial brick.
- Collaborated with clinical and commercial stakeholders at a major private hospital to estimate annual eligible patients and high-opportunity treatment areas; the resulting workflow was later shared nationally and adopted by 35 high-specialty consultants.

SELECTED MACHINE LEARNING PROJECTS

Technical data science experience developed through TripleTen's Data Science Bootcamp (March 2024 – March 2025) and further strengthened through independent machine learning projects and advanced coursework since March 2025.

Insurance Customer Profiling & Risk Prediction

Python, pandas, scikit-learn, KNN, Linear Regression

- Developed insurance-focused machine learning proof-of-concepts for customer similarity, claim probability prediction, claim frequency estimation, and privacy-preserving data transformation.
- Built KNN-based customer profiling models to identify similar clients for marketing use cases and evaluated the impact of feature scaling on similarity-based recommendations.
- Created a Linear Regression model from scratch using linear algebra and validated a data masking approach that protected customer information without affecting model performance.

Patient Readmission Risk Predictor

Python, pandas, scikit-learn, LightGBM, Random Forest, imbalanced-learn

- Built a healthcare classification model to predict 30-day patient readmission risk using demographic, clinical, hospitalization, prior visit, glucose, and blood pressure variables.
- Compared Logistic Regression, Decision Tree, Random Forest, and LightGBM models, prioritizing recall, F1-score, and ROC-AUC to better identify high-risk patients requiring follow-up.
- Applied feature engineering, one-hot encoding, scaling, and classification-threshold adjustment to improve recall in a clinically relevant risk prediction context.

Telecom Customer Churn Prediction

Python, pandas, scikit-learn, LightGBM, XGBoost

- Built an end-to-end churn prediction model by merging 4 customer-level datasets into a 7K+ customer dataset, engineering contract duration, and applying leakage-safe preprocessing.
- Compared Logistic Regression, Random Forest, XGBoost, and LightGBM using ROC-AUC and Accuracy; achieved 0.89 ROC-AUC and 0.84 Accuracy on the test set with LightGBM.
- Identified contract duration, total charges, monthly contracts, electronic check payments, and fiber optic service as key churn drivers, translating model outputs into retention recommendations.

EDUCATION

Professional Data Scientist Certificate

TripleTen / Instituto Tecnológico de Querétaro | 2025

Bachelor's Degree in Pharmaceutical Engineering

Instituto Politécnico Nacional | 2017

LANGUAGES

English: Full Professional Working Proficiency — B2+/C1
